About Environmental Economics

Our team of experienced consultants specialise in construction and building energy. We have qualifications in sustainability, energy, engineering, building physics and construction as well as environmental, quality management and auditing.

We develop flexible, practical, cost-effective specifications for our clients through identifying solutions and delivering design advice. This includes the following disciplines:

- *Energy Reports*
- *Sustainability Statements*
- *Compliance assessments and advice covering*
    - *Part L (SAP) & Future Homes Standard*
    - *Part F (ventilation)*
    - *Part G (water)*
    - *Part O (overheating)*
- *Overheating - TM59 dynamic modelling*
- *Overheating – simple method*
- *Life cycle carbon assessments*
- *Net zero carbon assessments*
- *BREEAM*
- *SBEM (existing and new build)*
- *Minimum Energy Efficiency Standards (MEES)*
- *Thermal Bridging (Psi value calculations)*

1. Executive Summary

1.1.1. This Energy and Sustainability report was prepared by Environmental Economics Ltd on behalf of Lochailort Newbury Ltd for the site Old Town, Newbury. The report assesses measures to reduce the carbon emissions across the site through the use of fabric efficiency and low/zero carbon technology including ground source heat pumps in a district heating network and photovoltaic (PV) panels.

1.1.2. The proposed development is designed to incorporate insulation measures and low carbon district heating in order to comply with Policy DM4 of the West Berkshire Local Plan (adopted June 2025).

1.1.3. The development will incorporate a ground source heat pump district heating network, providing low carbon heat in accordance with local and national policies.

1.1.4. A representative sample of the residential element have been assessed using SAP 10.2 compliant software, which are shown to deliver circa 71% reduction in Part L (2021) regulated emissions. This is in accordance with Policy DM4 which sets a target of a 63% reduction over Part L (2021). This also exceeds the predicted 49% betterment from the upcoming Future Homes Standard over current regulations (see section 2.3).

1.1.5. Policy DM4 sets FEE targets for various dwelling types used on site. This report demonstrates compliance with these targets (see section 4.1) through good fabric design intent.

1.1.6. A representative sample of the proposed retail units has been assessed using SBEM calculation engine v6.1.e.0 and can be seen to deliver circa 21% reduction in carbon emissions (regulated and unregulated) against Part L 2 (2021) regulations. This provides opportunity for BREEAM Excellent (shell only).

1.1.7. The concierge and shared residents' area (comprising a gym, kitchenette, parcel room, meeting room and toilets) was assessed using SBEM calculation engine v6.1.e.0 and delivered circa 10% reduction in carbon emissions (regulated and unregulated) against Part L 2 (2021) regulations. An operative energy calculation was also completed as required in the West Berkshire Local Plan, to consider the unregulated emissions of this area.

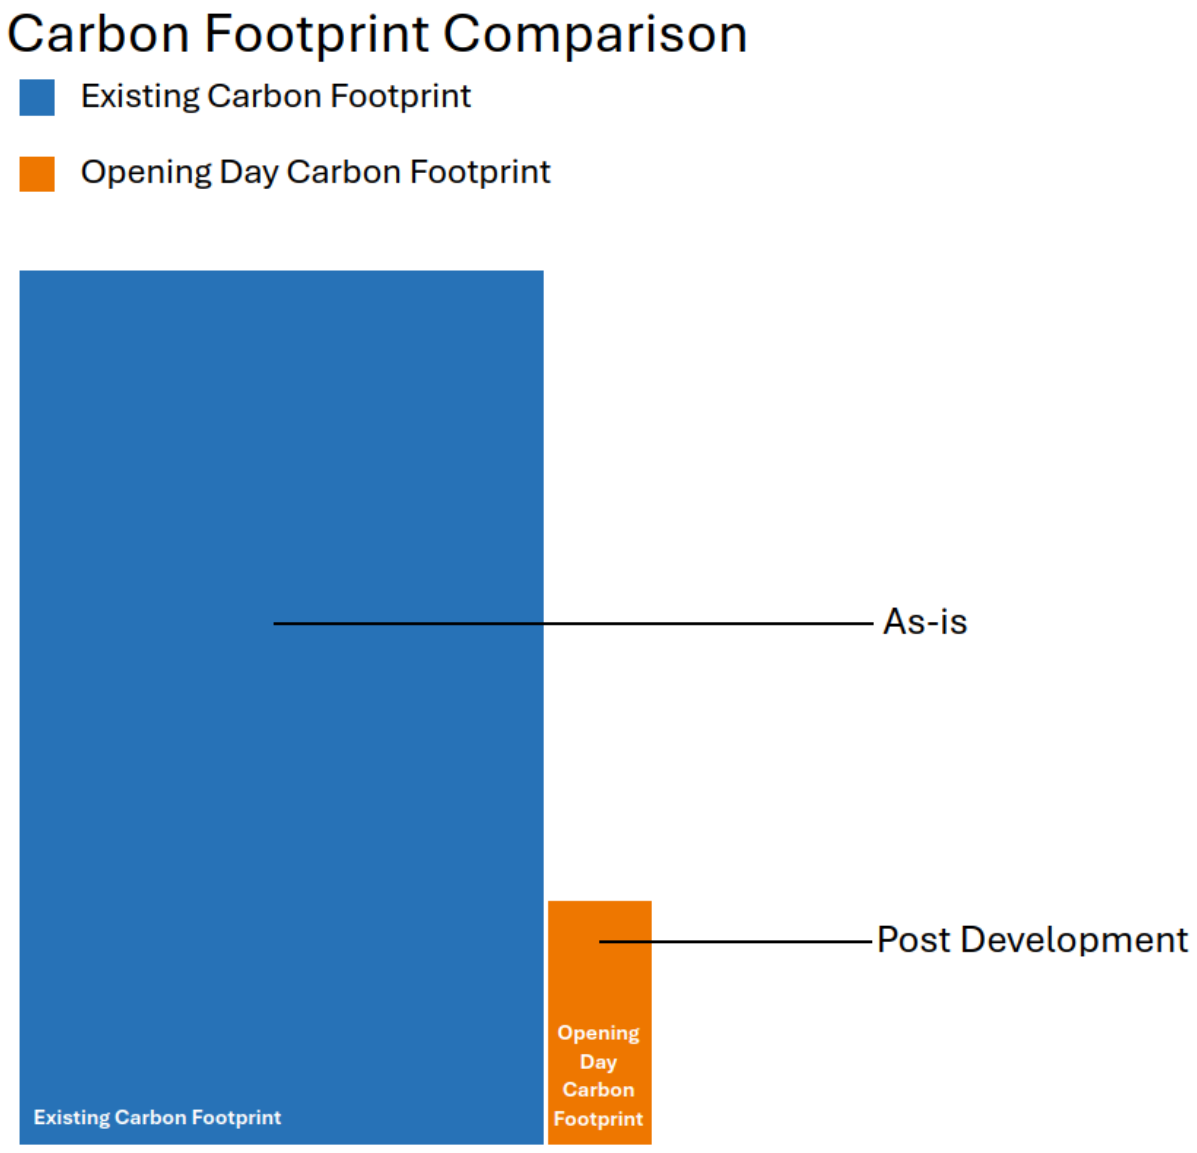
1.1.8. Policy DM4 sets a net zero carbon target which considers operational energy (regulated and unregulated) and allows for a cash in lieu payment to offset any residual carbon emissions from the site (domestic and non-domestic units). The proposed development aims to meet West Berkshires net zero carbon target ambition through use of renewable energy across the site in the form of ground source heat pumps connected to a district heating network and PV panels.

1.1.9. The reduction in carbon emissions from regulated and unregulated energy is demonstrated in sections 4.5 and 5.3 for residential and non-residential development respectively.

1.1.10. Proposed site wide total carbon emissions per year are 98 tonnes, a 68% improvement over the Part L 2021 baseline. The 98-tonne figure includes both regulated and unregulated carbon emissions for both the residential and non-residential units.

1.1.11. The proportional area chart (Figure 1 below) shows the predicted site wide total carbon emissions (orange rectangle) having a 97% improvement on the existing site which produces 3,040 tonnes/yr (blue rectangle).

Figure 1: Comparison of the carbon footprint between the proposed development and the existing site.



1.1.12. The use of smart meters will provide occupiers with real time data which will allow occupiers to manage their energy consumption, save money and reduce carbon. This is particularly important as the UK migrates towards half-hourly pricing levels and the proposed smart grid system.

1.1.13. The development strategy sets a high standard of overall sustainability, complying with Policy SP5, with measures that include:

- *Material suppliers with responsible sourcing certification guided by a high-quality sustainable procurement policy;*
- *Effective waste management procedures to minimise construction waste and to divert any residual waste from landfill;*
- *The implementation of drainage, ecology and travel plans;*
- *Provision of electric vehicle charging points within residential parking areas and separately to the public car park facility;*
- *Provision of secure cycle storage;*
- *Improved pedestrian access routes;*
- *Efficient internal and external water use in line with building regulations;*
- *Opportunity to achieve BREEAM Excellent.*

1.1.14. Potential overheating risk will be assessed in accordance with Approved Document O.

2. Project Overview

2.1. Description of Site

2.1.1. The site consists of 317 residential dwellings, 5 shell retail units and a concierge and shared residents area for the residential units (including a concierge, gym, meeting room, kitchen and postal room). The residential units comprise a range of terraced housing, duplex maisonettes, duplex flats and traditional flats.

2.1.2. The proposed site location/boundary for the whole site is shown in Appendix A.

2.1.3. This report addresses a development being undertaken by Lochailort Newbury Ltd, and does not include any further proposals for subsequent developments.

2.1.4. The retail units have been modelled with an assumed fit out specification.

2.2. Planning Policy

2.2.1. The planning authority for this site is West Berkshire Council.

2.2.2. Within the West Berkshire Local Plan (adopted June 2025), the relevant policies are the following:

2.2.3. Policy DM4:

Building Sustainable Homes and Businesses

New development of one or more new dwellings (C3 or C4 use class) and/or 100sqm or more of new non-residential floorspace, including hotels (C1 use class), residential institutions (C2 use class) or Secure Residential Institutions (C2A use class) should achieve net zero operational carbon emissions (regulated and unregulated energy) by implementing the energy hierarchy.

Proposals should demonstrate application of the energy hierarchy through submission of an Energy Statement or a detailed energy section within the Sustainability Statement in accordance with policy SP5 and which identifies how the following minimum standards of construction are achieved to the greatest extent feasible and viable.

1. Residential Development - minimum construction standard

A. New development of one or more new dwellings (C3 or C4 use class) will meet the following minimum standards of construction:

• Achieve the carbon Target Emission Rate set by the Future Homes Standard once this is confirmed by central government; in the meantime, achieve 63% reduction in carbon emissions is achieved by on-site measures, as compared to the baseline emission rate set by Building Regulations Part L 2021 (SAP 10.2). These regulated carbon emission targets are to be achieved before the addition of on-site renewable electricity generation (which should subsequently be considered in section 3 of this policy); and

• Equal to or less than the following targets, using the Building Regulations Part L SAP Fabric Energy Efficiency (FEE) metric:

o End terrace: 32.9 kWh/m2/year FEE

o Mid terrace: 25.1 kWh/m2/year FEE

o Room in roof (semi detached): 32.5 kWh/m2/year FEE

o Detached: 43.6 kWh/m2/year FEE

o Bungalow: 51.0 kWh/m2/year FEE

o Low-rise apartment: 21.0 kWh/m2/year FEE

o Mid to high-rise apartment: 13.5 kWh/m2/year FEE

o Where the proposed home type does not precisely reflect any of the above, the applicable target from the list above will be that of the most similar home type to that proposed, with a note to justify why this is thought to be the most similar. In apartment buildings, it will be acceptable to meet this target via a weighted average of all residential floor space in the building (recognising that there may be variation between floors in the building).

• For outline applications and where the home type is not known, it will be required to commit to delivering the relevant target(s) through reserved matters. This will be secured by a condition.

B. Residential refurbishment developments of 10+ units will meet BREEAM Domestic Refurbishment 2014 (or future equivalent) Excellent as a minimum.

2. New Non-Residential Development, including hotels, residential institutions, secure residential institutions - minimum construction standard

New development of 1 00sqm or more of new non-residential floorspace, including hotels (C 1 use class), residential institutions (C2 use class) or secure residential institutions (C2A use class) will meet the following minimum standards of construction:

• Appropriate to the building type, calculate a typical building baseline using a nationally recognised standard and demonstrate a percentage reduction in energy (regulated and unregulated) carbon emissions. These operational carbon emission targets are to be achieved before the addition of on-site renewable electricity generation (which should subsequently be considered in section 3 of this policy); and

• BREEAM Excellent (BREEAM New Construction V6 or future equivalent).

3. Renewable Energy

A. Subsequent to the achievement of the minimum construction standards under parts 1 and 2, new development of one or more new dwellings (C3 or C4 use class) and/or 100sqm or more of new non-residential floorspace, including hotels (C1 use class), residential institutions (C2 use class) or Secure Residential Institutions (C2A use class) should include onsite renewable, zero

and low carbon energy technologies to achieve net zero carbon operational energy (regulated and unregulated) on site.

B. The Council will support proposals for renewable energy provided that the technology is:

i. Suitable for the location;

ii. Not on the most versatile agricultural land (grades 1, 2 and 3a);

iii. Is accompanied by a landscape / visual impact assessment; and

iv. Would not cause harm to residential amenity by virtue of noise, vibration, overshadowing, flicker or other harmful emissions.

4. Carbon Offsetting

Where a development proposal of one or more new dwellings (C3 or C4 use class) and/or 100sqm or more of new non-residential floorspace, including hotels (C1 use class), residential institutions (C2 use class) and or secure residential institutions (C2A use class) cannot demonstrate that it is net zero carbon in relation to operational energy (regulated and unregulated), it will be required to address any residual carbon emissions by a cash in lieu contribution.

2.2.4. Policy SP5

Responding to Climate Change

The principles of climate change mitigation and adaptation will be required to be embedded into new development, improving the resilience of land, buildings and existing and future communities to the opportunities and impacts arising from climate change. All development should contribute to West Berkshire becoming and staying carbon neutral by 2030. Depending on the nature and scale of proposals, development will be expected to satisfy the following criteria:

a. To withstand predictable effects from climate change for its expected lifetime;

b. To take advantage of the latest low and zero carbon technologies and innovations, including digital;

c. To achieve net zero operational carbon development by applying the energy hierarchy, achieving the highest viable levels of energy efficiency, generating and supplying renewable, low and zero carbon energy, and as a last resort carbon offsetting in accordance with policy DM4;

d. To achieve the highest viable levels of energy efficiency;

e. To generate and supply renewable, low and zero carbon energy for its own use and/or local distribution networks in accordance with policy DM4;

f. To provide for sustainable forms of vehicular and personal transport to and from the site and reduce car use in accordance with policies SP19, DM44 and DM45;

g. To enable recycling and waste reduction both during construction and occupation;

h. To manage and conserve adequate water resources and avoid harming water quality and improve it where possible in accordance with policies DM7 and DM6;

i. To demonstrate that flood risk from all sources can be avoided or managed in accordance with policy SP6;

j. To use sustainable urban drainage systems in accordance with policy SP6;

k. To provide for green/blue infrastructure and open spaces within the layout for shading and cooling, to detain surface water run-off and absorb carbon dioxide emissions in accordance with policy SP10;

l. To improve wildlife habitat and species conservation and connectivity to allow for movement in response to climate change in accordance with policy SP11; and

m. To maintain the integrity of the historic environment and to respect the character and improve the environmental performance of heritage assets without compromising their significance in accordance with policy SP9. This necessitates taking a whole building approach informed by heritage expertise.

Proposals should be accompanied by a Sustainability Statement which demonstrates how these principles have been embedded into the development. The level of information provided should be proportionate to the scale and nature of the development proposed.

2.3. Building Regulations

2.3.1. The 317 dwellings, 5 shell retail units and concierge and shared residents' area comprising this development currently fall under Part L 2021 of the building regulations and will be required to follow SAP 10/SBEM methodology. Part L 2021 regulations have a higher standard in carbon requirements than Part L 2013. Specifically, any of the plots on site which are to be built to Part L 2021 (using SAP 10) will exceed current Part L1A 2013 building regulations by 31%.

2.3.2. In addition to the higher standards, some of the carbon content for different types of fuel has changed, meaning that the resultant carbon emissions will be calculated differently.

2.3.3. At present, the Future Homes Standard is in the consultation process headed by the UK Government. There are two transitional periods proposed, but it's likely that part, if not all the units on site will fall under FHS regulations.

2.3.4. The former government minister Christopher Pincher is quoted as saying, "A new home built to Future Homes Standard in 2025 is to have 75-80% lower carbon emissions than Part L 2013."

2.3.5. Based on the above statement and the 31% betterment from Part L1A 2013 to Part L1A 2021 regulations (2.3.1), it can be reasoned that the likely betterment over current regulations (Part L 2021) will be 49%.

2.3.6. Currently, there is no modelling software available to test whether the sample housetypes will pass the future regulations. Therefore, we have used SAP 10 methodology, but set a target of a 49% betterment in CO2 emissions over the current regulations as follows:

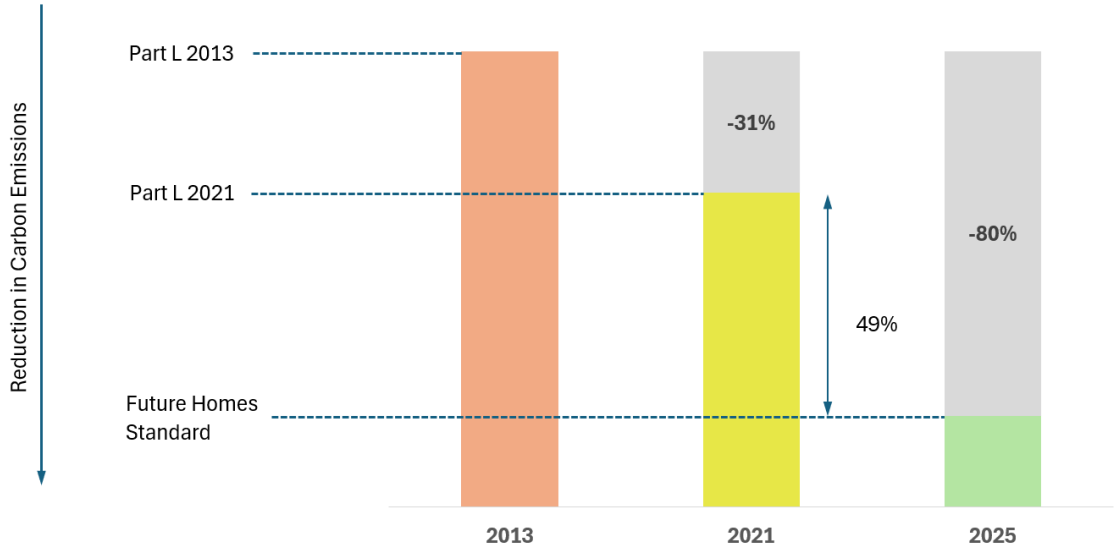


Figure 2: Regulatory targets for Carbon emissions. Percentage figures are reductions over Part L 2013 baseline.

3. Improvement Measures

3.1. Assessment Methodology

3.1.1. Environmental Economics has modelled the proposed development using Government approved software:

a. Dwellings are assessed using Design SAP 10 from Elmhurst Energy.

b. The retail units have been assessed using DesignBuilder v7.2.0, using the SBEM calculation engine v6.1.e.0.

3.1.2. These software tools provide a number of outputs which can be used to assess and compare the improvements from any number of build specifications in terms of:

- *Building regulations compliance*
- *Energy usage per year (kWh/annum)*
- *Carbon emissions as a measure of building regulations compliance (kg CO_2/m2/year)*
- *Energy costs per year (£/annum)*
- *More detailed breakdowns by end use (space heating, water heating, cooking, lighting, appliances)*
- *Ene 01 compliance (Designbuilder v7.2.0)*
- *Effective air change rate*

3.1.3. Each of these outputs can be used in different ways to analyse the performance of the dwelling. The total regulated carbon emissions for each property are based upon:

- *Space heating*
- *Water heating*
- *Electricity for pumps and fans*
- *Electricity for lighting*

3.1.4. Two SAP models were created in order to calculate the domestic energy demand. The required data for the site is calculated for each of the models, and then the difference used to establish the level of improvement.

3.1.5. Sample SAP 10 reports for residential units are shown in Appendix L.

3.1.6. A sample retail unit was modelled using Designbuilder.

3.1.7. The sample retail and concierge and residents' area SBEM outputs (BRUKLs) are found in Appendix J.

3.1.8. For non-domestic buildings, the iSBEM User Guide v6.1.d confirms the following:

SBEM is a compliance and energy certification procedure and not a design tool. If the performance of a particular feature is critical to the design, even if it can be represented in SBEM, it is prudent to use the most appropriate modelling tool for design purposes. In any case, SBEM should not be used for system sizing.

3.1.9. While the SAP and SBEM assessments provided within this report represent potential opportunities for the proposed development to comply with AD-L 2021 and the West Berkshire Policy DM4, it is incumbent on the appointed design engineers to review the performance requirements for the final design and adopt suitable systems.

3.2. Design Philosophy

3.2.1. Upgrades have been made to a number of elements from a standard build specification in order to improve energy efficiency across the development.

3.2.2. The proposed development adopts nationally recognised design and construction principles as the industry moves towards zero carbon. The principles are illustrated in Figure 3 below.

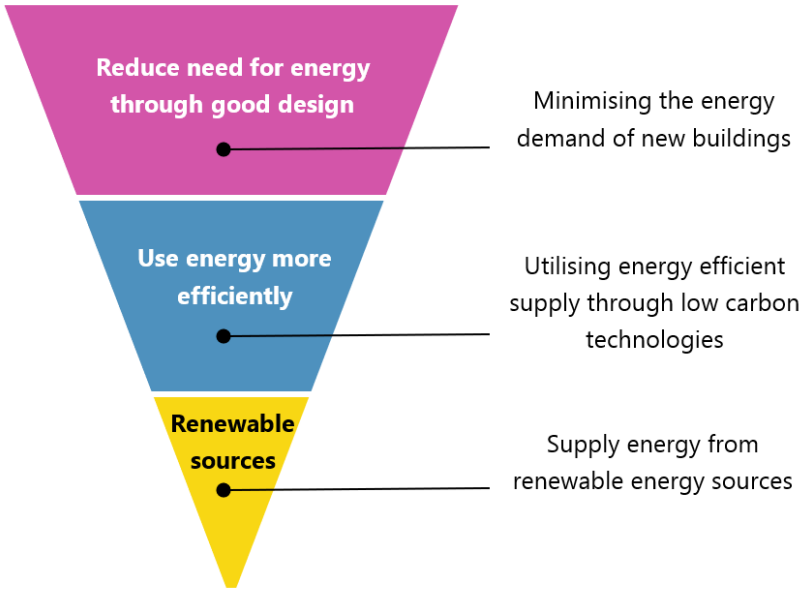

Figure 3 – The Energy Hierarchy

3.2.3. In order to reduce the residual carbon emissions a number of improvements were made to the standard material and product specification. These improvements include:

- *Upgraded heating and hot water controls.*
- *Delayed start thermostat.*
- *Design air permeability of 3.00m³/hr/m² for the residential and retail units.*
- *Bespoke thermal bridging details.*

3.3. Fabric Improvements Part L 2021

3.3.1. The building fabric for all dwellings within the proposed development will be improved in comparison to ADL 2013 specifications, and in relation to the ADL 2021 backstop notional specification. These fabric improvements reduce the space heating requirement upon a property. The improvements will be made through a combination of upgraded materials and increased insulation thicknesses. Enhanced glazing with a larger transmittance factor allowing for increased solar gains will also be used in dwellings.

3.3.2. Proposed fabric designs and U-Values used in the domestic energy calculations can be found in Table 1 below.

Table 1: Draft Build Specification

Element	***Minimum Standard***	***Improved Specification***	
-	***W/m²k***	***Description***	***W/m²k***

Doors	1.60	Double glazed Low-E, Wood frame	1.1
Glazing	1.60	Double/Triple glazed Low-E, Wood frame,	0.8-1.1

3.3.3. Proposed fabric designs and U-Values used in the non-domestic energy calculations can be found in Table 2 below:

Doors	1.60	Doors where >50% of the area is glazed are modelled as windows as per National Calculation Methodology	-
Glazing	1.60	Frame factor = 0.1	1.0

3.3.4. Please note that this specification is not finalised and is subject to change up until detailed design stage.

3.3.5. As improvements are made to the thermal conductivity of main elements, thermal bridging and air permeability becomes increasingly significant in the overall fabric performance. Thermal bridges achieving a y-value of 0.03 has been used. This results in much lower heat loss levels in comparison with standard practice.

3.3.6. As a result of following these junction details and focusing on build quality air permeability will also decrease. A target air pressure rating of 3.00m^3/hr.m^2 has been set for all houses and retail units, which is an improvement on the maximum allowable rating in the 2021 Building Regulations.

3.4. Building Services & Renewable Energy (LZCT) in Domestic Units

3.4.1. The systems used in a property to supply hot water and heating, as well as to control it, are important to the overall energy demand of a property. AD-L 2021 includes requirements for efficiency and controls of such equipment, including space heating, water heating, ventilation, and lighting.

3.4.2. The design of building services which provide space heating and domestic hot water, ventilation, and lighting, must be considered in a holistic way in order to avoid unintended consequences and to maximise the benefits from such systems.

3.4.3. A district heating network utilising ground source heat pump bore holes from multiple plant rooms is proposed to provide heating and hot water across the site. The scheme is to be designed by ERDA/BMD who have provided an estimation of the main performance figures:

- ***Coefficient of performance (CoP) of 3.75***
- ***Distribution loss factor (DLF) over the network of 1.5.*** *This is in accordance with the CIBSE/ADE CP1 'Heat Networks: Code of Practice for the UK'.*

We have used the above figures for the sample SAP calculations. Please note, these figures are an estimation and may change at detailed design stage. More information on the district heating system can be found in Appendix B.

3.4.4. Subject to feasibility, the proposed development will incorporate photovoltaic (PV) systems. The sample SAPs are based on an average of 3.1 PV panels per dwelling. Upon detailed design stage, the exact number of panels per dwelling may change following a feasibility assessment undertaken by the PV installer.

3.4.5. Heat Interface Units (HIU) are proposed to be installed to all dwellings connected to the heat network. HIU's utilise one or two plate heat exchangers to provide instantaneous heating and hot water. See Appendix B for more information.

3.4.6. Decentralised Mechanical Extract Ventilation (dMEV) fans are proposed to be installed to all residential dwellings as the ventilation strategy. dMEVs manage humidity and are significantly more energy efficient and quieter in comparison to standard extractor fans.

3.4.7. Shower type is assumed to be a thermostatic mixer shower with a flow rate of 8L/min connected to an unvented hot water system.

3.4.8. Lighting provision will be from LED low energy fittings achieving a minimum efficacy of 100 lamp lumens per circuit Watt, an improvement of over 50% from AD-L 2013 performance levels.

3.4.9. Smart meters will be installed on all properties, providing:

- Real time information on energy use both in terms of consumption and cost
- Occupier can manage their energy, save money, and reduce carbon emissions.
- Smart meters will also allow for easier switching between suppliers.
- Facilitate a more reactive, price driven, demand-response.
- End estimated billing and eliminate the need for meter readers to visit premises.

3.5. Building Services & Renewable Energy (LZCT) in Non-Domestic Units

3.5.1. It was assumed that the shell retail units would not be connected to the heat network, and instead a typical fit out had been assumed in line with the recommendations of CIBSE Guide B0 (2016).

3.5.2. A split system has been modelled in a sample retail unit, utilising two Mitsubishi PLA-ZM50 internal cassettes and a PUZ-ZM100 outdoor unit, providing space heating and cooling with optimum start/stop control, local time control and temperature control.

3.5.3. This system used air source heat pumps, with an efficiency of 480%. Air source heat pumps are a low or zero carbon technology.

3.5.4. Electric instantaneous hot water was modelled as the commercial hot water system.

3.5.5. Lighting provision was assumed to be from LED low energy fittings achieving a minimum efficacy of 130 lamp lumens per circuit Watt.

3.5.6. A detailed summary of the fabric and services used in the SBEM model is provided in Appendix K.

3.5.7. The concierge and shared residents' area in Pellow House was modelled as fully fitted with underfloor heating supplied by the heat network. Central time control and optimum start/stop control optimise energy use for space heating. The system was assumed to include provision for metering to enable the building manager to monitor energy use. An alarm for 'out of range' values has been included to alert the building manager of any potential malfunctions.

3.5.8. LED lighting is to be supplied to all areas in the concierge and shared residents' area with an efficiency of 130 Lumens/Watt. The meeting room is controlled with a switch and photo electric sensor that switches off the lights when daylight provides sufficient lighting.

3.5.9. The other zones in the concierge and shared residents' area are controlled by occupancy sensors, with photoelectric sensors also provided to the concierge and gym area. Occupancy sensors ensure the lights are not left on when the room is unoccupied, saving energy, whilst also turning on as soon as a building user enters the room, removing the inconvenience of building users searching for a light switch in a dark room.

3.5.10. The concierge and shared residents' area includes a small gym. The heating system has been assumed in line with CIBSE Guide B0 (2016), which states that effective ventilation is usually the most critical factor when services fitness suites/weight training areas. Hence, an MVHR system is proposed throughout the concierge area, kitchenette, meeting room and gymnasium. Comfort cooling is to be provided to the gym via a split system.

3.6. TM54 Aims

3.6.1. Whilst Part L compliance calculations (SAP & SBEM) provide some insights regarding predicted energy consumption, there exists a performance gap between the Part L results and actual post-occupancy energy use.

3.6.2. The Chartered Institute of Building Services Engineers (CIBSE) have developed an alternative method of calculating building energy consumption, referred to as TM54.

3.6.3. TM54 assesses operational energy use, covering both regulated and unregulated energy uses. TM54 is a highly detailed HVAC (heating, ventilation and air-conditioning) modelling assessment, dependent on specific uses for each space assessed. Therefore, for shell only projects, TM54 calculations are not appropriate since the fit-out and specific use of each space is unknown. Operational energy credits (Ene 01 in BREEAM UK New Construction V.6.1) are not applicable to shell only BREEAM assessments.

3.6.4. The key principles of TM54 are to assist in designing in-use energy consumption targets, supply prospective building owners and occupiers with a clearer indication of predicted energy use and running costs, and to enable prospective occupiers to understand which energy performance measures have the greatest impact on energy use.

3.7. TM54 Methodology

3.7.1. Designbuilder v7.3.1.003 was used to create a dynamic simulation model (DSM) of the concierge and shared residents' area in Pellow House, comprising a concierge, gym, toilets, kitchenette, postal room and meeting room. The building envelopes (floor areas, wall areas, room volumes, U-values, Psi values, thermal mass) were taken from the planning drawings and SBEM model respectively.

3.7.2. Detailed HVAC modelling was conducted to best represent the proposed servicing strategy. Template modelling was considered but deemed inappropriate due to the complex nature of the proposed system. See Table 4 for more details regarding the benefits and caution points arising from detailed HVAC modelling.

3.7.3. Typically, at planning stage, template HVAC modelling would be used, however this was deemed inappropriate due to the complexity of the proposed system.

3.7.4. TM54 states that appropriate weather files should be considered for scenario modelling. The energyplus IWEC weather files can be used to represent a typical year, and the CIBSE_DSY1_2020_High50_ weather files can be used to represent a heat wave with a seven-year return in the high emissions climate change scenario.

3.7.5. At detailed design, the TM54 calculation should be rerun with more information added to the model regarding the specific product efficiencies and fine tuning of the proposed system. As per BREEAM Ene 01 methodology, energy consumption targets should be reported to BRE.

Table 4. Benefits and caution points on detailed HVAC modelling (from CIBSE TM54, 2022)

Benefits of including detailed HVAC modelling	***Caution points about detailed HVAC modelling***
Identifies opportunities to optimise the design of HVAC plant and controls, for a more efficient building with lower utility costs.	HVAC modelling as an 'isolated' or 'one-off' exercise will most likely not enable buildings on their own to achieve their operational energy targets. Instead, the approach needs to be iterative and fully embedded in the design, construction and handover process with sufficient expertise in the team and resource allocated in the programme.
Provides a 'dress rehearsal' of the proposed HVAC design that can flush out problems that otherwise may not have been picked up until installation or commissioning.	The detail of HVAC modelling should reflect the project's requirements, level of accuracy required, and type of systems present in the building.
Provides the client with increased assurance that operational targets are achievable.	Detailed HVAC modelling relies on a range of detailed inputs which, especially at the early design stages, may be subject to much uncertainty. It is therefore recommended to consider the probable ranges and confidence levels for key input data to have a better understanding of the uncertainty of the results and how this could be managed as a project evolves.
Provides increased accuracy of operational energy usage forecasting and scenario testing.	A review of the modelling report (and associated design) is recommended, as in all models, to reduce risk and address the above points.
Enables the simulation model to be a more useful tool to assist in the fine tuning of buildings in operation.	
Can hold designers and contractors more accountable for in-use performance.	

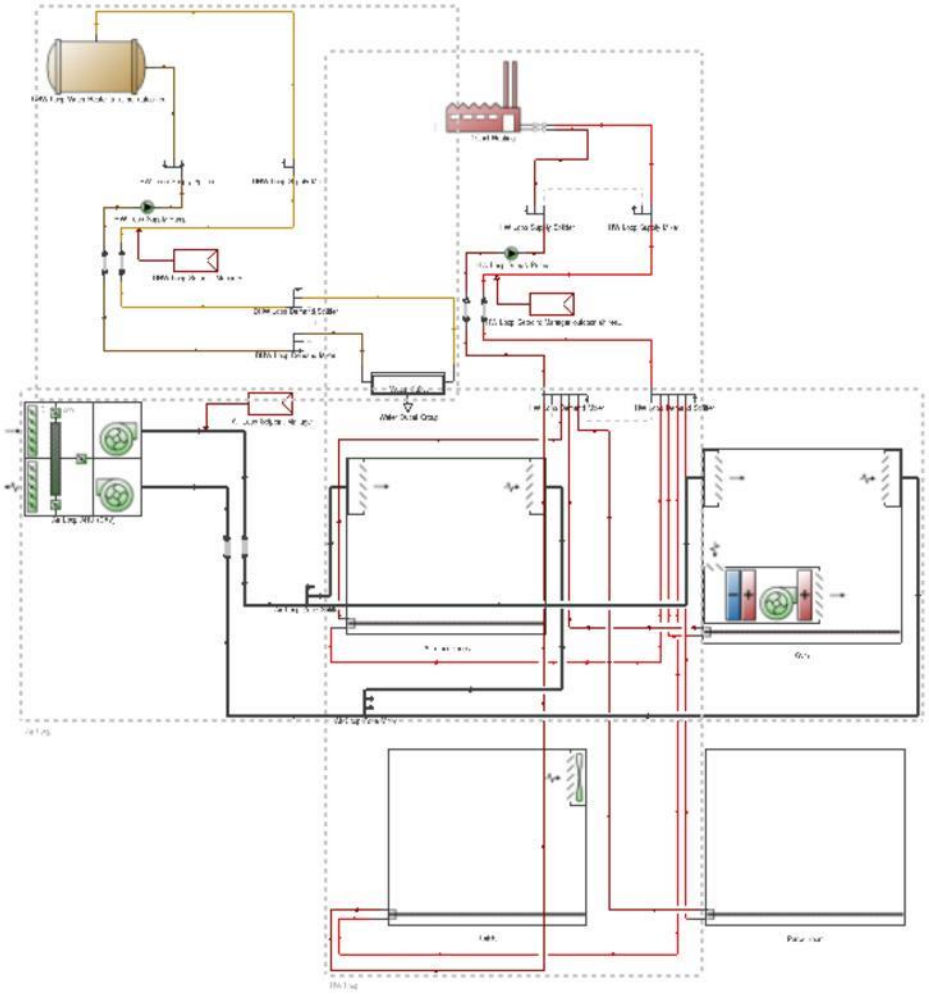

Figure 4. Detailed HVAC system modelled in DesignBuilder.

3.7.6. Figure 4 shows a visualisation of the detailed HVAC system modelled in DesignBuilder, comprising an underfloor heating system with MVHR serving all zones in the concierge and shared residents' area (except for the maintenance store). The gym is also serviced by an air-source heat pump system to provide cooling.

3.8. TM54 Scenarios

3.8.1. Two scenarios have been considered. One is a 'worst-case' operation where the MVHR system is left running continuously in all zones. This may increase energy consumption and supply air to zones during night hours with no predicted occupancy. In this scenario, the cooling system is left running continuously in the gym, such that active cooling will be provided during the night should the air temperature exceed the set point values.

3.8.2. The second scenario has scheduled operation of the MVHR in all zones and air conditioning system in the gym to optimise comfort whilst reducing energy use outside of occupied hours.

3.8.3. Each scenario was modelled in the GBR_LONDON_GATWICK_IWEC weather file to represent a typical weather scenario, and in the CIBSE_DSY1_LGW_2020_High50_ weather file to represent a heat wave with a seven-year return. This will add additional strain to the MVHR and air-conditioning services, which may represent the higher demands for this unit.

3.8.4. The system is automatically sized by DesignBuilder software based on predicted demand and room volumes.

4. Results - Residential

4.1. Fabric Energy Efficiency (FEE)

4.1.1. Policy DM4 sets out FEE targets for various types of residential dwellings.

4.1.2. Sample SAPs were produced following the specification outlined in this report.

4.1.3. To ensure accuracy, average DFEE outputs from the 8 orientations in SAP have been taken for each sample SAP and averaged.

4.1.4. For flats and maisonettes (duplex and single story) we applied a floor area weighted average to return a 'block' DFEE. Full calculation tables for this are shown in Appendix C.

4.1.5. Table 5 summarises the results along with a target FEE

4.1.6. The target FEE for flats and duplex flats is calculated based on the following:

- *Max of 6 stories per block*
- *Dwellings on 5th and 6th stories classed as mid-rise, falling into the 13.5 target FEE category.*
- *Dwellings on stories 1 to 4 will be classed as low rise, falling into the 21.0 target FEE category.*
- *2/3rds of dwellings in the block are low rise and 1/3rd is mid-rise.*
- *Therefore, a weighted target FEE is calculated by:*

$$\left(\frac{2}{3}\ X\ 21.0\right) + \left(\frac{1}{3}\ X\ 13.5\right) = 18.5$$

4.1.7. Results are shown below.

Table 5: Fabric Energy Efficiency (FEE) summary table

Typology	Category	Target FEE	DFEE
End Terrace	**End Terrace**	**32.9**	**32.5**
Mid Terrace	**Mid Terrace**	**25.1**	**23.6**
Maisonette/Duplex Maisonette	**Low-rise apartment**	**21.0**	**21.0**
Flats	**Low-rise apartment** **Mid to high rise apartment**	**18.5**	**17.6**
Duplex Flats	**Low-rise apartment** **Mid to high rise apartment**	**18.5**	**17.7**

4.2. Onsite Renewables Cross Check Table

4.2.1. Following guidance provides by West Berkshire Council, a renewables cross check table is provided below.

4.2.2. Where total PV generation is equal to or greater than the combined annual regulated and unregulated energy demand, this will be considered net zero operational energy and deemed policy compliant.

4.2.3. In this case, total annual PV generation does not exceed total annual energy use. This is based on an average of 3.1 PV panels per dwelling. Upon detailed design stage, this may change following a feasibility assessment undertaken by the PV installer.

Table 6: Onsite renewables cross check table

Total annual energy use (regulated and unregulated – KWh	**613,951**
Total annual PV energy generation - (KWh)	**303,756**

4.3. Regulated Carbon Reduction

4.3.1. Distribution loss factor (DLF) and Coefficient of Performance (entered as efficiency in SAP 10 software) are two critical data points that influence the level of emissions for the residential units.

4.3.2. We have modelled sample SAPs for end and mid terrace houses, duplex maisonettes, and ground floor, mid floor and top floor flats. The average reduction in regulated CO2 emissions across site over Part L 2021 for the residential units was 71%. See Table 7 below and in depth calculation in Tables 17 and 18 in Appendix D.

Table 7: Energy Summary Table – 'Be Lean' and 'Be Clean' (Regulated emissions only)

Stage	Energy Use (kWh per annum)	Total CO_2 emissions (Tonnes CO_2 per annum)	Percentage Reduction Of Total CO_2 emissions (Tonnes CO_2 per annum)
Baseline Part L 2021 of the Building Regulations Compliant Development	**1,073,886**	**246**	
Be Lean: Fabric First and Servicing Improvement - savings from demand reduction (FEE metric)	**1,148,709**	**235**	**4%**
Be Clean: Supply energy Efficient	**481,274**	**72.0**	**71%**

4.4. Unregulated Carbon Emissions

4.4.1. The Good Homes Alliance (GHA) provide a method for calculating unregulated energy demand for residential dwellings (see Appendix F).

4.4.2. Using figures calculated from the GHA, we can deduce total unregulated carbon emissions for all the residential units on site. This is calculated to be 59.4 tonnesCO_2/annum for the residential units.

4.5. Total Carbon Reduction

4.5.1. To comply with policy DM4, the total carbon emissions reduction was calculated. It is necessary to consider both regulated and unregulated carbon emissions for this calculation.

4.5.2. For the residential units, the baseline total carbon is 305 tonnesCO_2/annum. The proposed scheme total carbon is 93 tonnesCO_2/annum. This results in a 70% reduction in total carbon for the residential units. See Table 8 below and Tables 19, 20 and 21 in Appendix E.

Table 8: Energy Summary Table – 'Be Lean', 'Be Clean' and 'Be Green' (Regulated and Unregulated emissions)

Stage	Regulated Energy Use (kWh per annum)	Unregulated Energy Use (kWh per annum)	Total CO_2 emissions Regulated and Unregulated (Tonnes CO_2 per annum)	Percentage Reduction Of Total CO_2 emissions Regulated and Unregulated (Tonnes CO_2 per annum)
Baseline Part L 2021 of the Building Regulations Compliant Development	**1,073,886**	**436,432**	**305**	
Be Lean: Fabric First and Servicing Improvement - savings from demand reduction	**1,148,709**	**436,432**	**295**	**3%**
NEW BASELINE Be Clean: Supply energy Efficient	**481,274**	**436,432**	**131**	**57%**
Be Green: Use onsite renewable, zero and low carbon energy technologies	**177,519**	**436,432**	**93**	**70%**

4.6. Carbon Offsetting

4.6.1. To reach the net-zero carbon emissions target, it is necessary to calculate the residual carbon produced by the proposed development, which can then be addressed via a cash in lieu contribution.

4.6.2. As the site is all electric and will be powered by GSHPs for the domestic and non-domestic units, CO_2 emissions year-on-year will reduce as the carbon intensity of generating grid electricity reduces through decarbonisation.

4.6.3. Section 10.30 and 10.31 of the West Berkshire Local Plan (adopted June 2025) provides guidance for calculating carbon offsets, factoring in grid decarbonisation and citing Treasury Greenbook as a data source.

4.6.4. West Berkshire Council have produced a carbon offset calculator. Using this, the total carbon offset to achieve net-zero was calculated to be **£124,539.27 for the residential units.** Please refer to separate offset calculator spreadsheet for these calculations.

5. Results – Non-Residential

5.1. TM54 calculation

5.1.1. The results show that in a heat wave year, there is less load on the system overall, likely due to reduced heating demand. The gym is the only zone with active cooling, so whilst energy demand for cooling increased in the heat wave year, this was offset by reduced heat demand (Table 9).

Table 9. Summary of the total energy consumption arising from each scenario modelled across two weather files.

		Weather file	
		Typical weather year (IWEC weather file)	*Heat wave year (CIBSE DSY1 2020 High 50 weather file)*
Operation schedule	*Local mechanical extract and air-conditioning on 24/7*	15,287 kWh	15,090 kWh
	Local mechanical extract and air-conditioning on during occupied hours only	14,232 kWh	13,962 kWh

5.1.2. The operational energy of the building was primarily driven by room electricity, i.e. white goods used in the office areas. Lighting was the second highest energy demand, followed by system fans. Heating, cooling and domestic hot water were much lower than the unregulated energy demand. Figure 5 shows the demand for each load.

5.1.3. To improve operational energy efficiency, care should be taken when specifying white goods such as computers, monitors, televisions and utensils in the kitchenette.

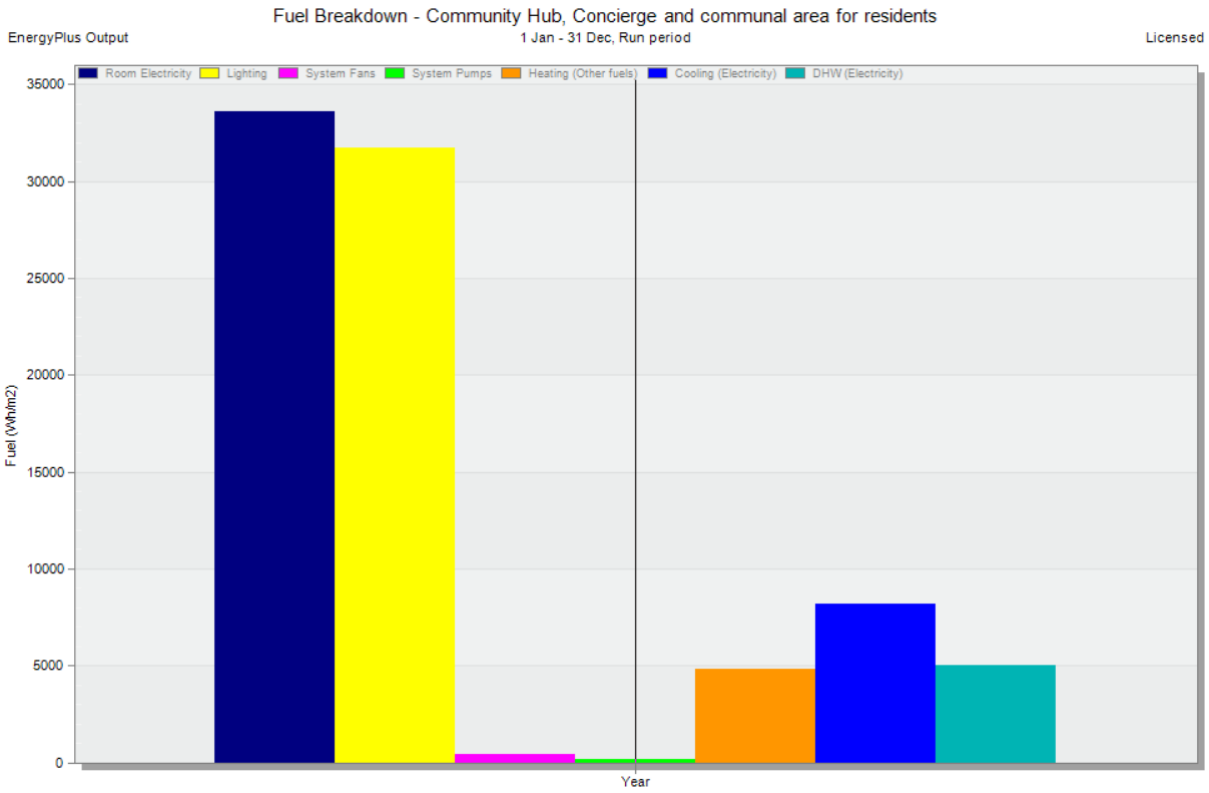

Figure 5. Bar chart showing the annual energy consumption in Wh/m^2 for a typical weather year.

5.2. Carbon Reduction (Regulated and Unregulated)

5.2.1. By assessing a sample retail unit and extrapolating across the retail units on site, these units achieve a 21% betterment over the current regulations.

5.2.2. Carbon emissions are estimated to be 3 tonnesCO_2/annum for the retail units. This is derived from the equipment loads in the BRUKL SBEM output. TM54 was not applied to the retail units because this is not an appropriate methodology for assessing shell only units. Hence, the BREEAM Ene 01 operational energy criteria are not applicable to shell only assessments.

5.2.3. The concierge and shared residents' area achieved a 10% betterment over Part L 2021. These results have been combined with those of the retail units to produce Table 10.

5.2.4. The unregulated energy use for the concierge and shared residents' area has been calculated using the TM54 results.

Table 10: Energy Summary Table – 'Be Lean' and 'Be Clean' (Regulated and Unregulated emissions) for the non-domestic units

Stage	Regulated Energy Use (kWh per annum)	Unregulated Energy Use (kWh per annum)	Total CO_2 emissions Regulated and Unregulated (Tonnes CO_2 per annum)	Percentage Reduction Of Total CO_2 emissions Regulated and Unregulated (Tonnes CO_2 per annum)
Baseline Part L 2021 of the Building Regulations Compliant Development	**22,007**	**22,864**	**6**	
Be Lean: Fabric First and Servicing Improvement - savings from demand reduction	**21,349**	**21,809**	**6**	**4%**
Be Clean: Supply energy Efficient	**15,954**	**21,809**	**5**	**16%**

5.3. Total Carbon Reduction

5.3.1. As per the guidance provided in the West Berkshire Council Sustainability Position Statement and Guidance, the highly efficient air-source heat pumps specified in the retail unit SBEMs and the ground source heat pump district heating network have been classified as 'Be Clean' strategies.

5.3.2. For simplicity, the photovoltaic arrays on the roofs of the proposed development have been assigned to the residential units.

Table 11: Energy Summary Table – 'Be Lean', 'Be Clean' and 'Be Green' (Regulated and Unregulated emissions)

Stage	Regulated Energy Use (kWh per annum)	Unregulated Energy Use (kWh per annum)	Total CO_2 emissions Regulated and Unregulated (Tonnes CO_2 per annum)	Percentage Reduction Of Total CO_2 emissions Regulated and Unregulated (Tonnes CO_2 per annum)
Baseline Part L 2021 of the Building Regulations Compliant Development	22,007	22,864	6	
Be Lean: Fabric First and Servicing Improvement - savings from demand reduction	21,349	21,809	6	4%
NEW BASELINE Be Clean: Supply energy Efficient	15,954	21,809	5	16%
Be Green: Use onsite renewable, zero and low carbon energy technologies	15,954	21,809	5	16%

5.4. Carbon Offsetting

5.4.1. To reach the net-zero carbon emissions target, it is necessary to calculate the residual carbon produced by the proposed development, which can then be addressed via a cash in lieu contribution.

5.4.2. As the site is all electric and will be powered by GSHPs for the domestic and non-domestic units CO_2 emissions year-on-year will reduce as the carbon intensity of generating grid electricity reduces through decarbonisation.

5.4.3. Section 10.30 and 10.31 of the West Berkshire Local Plan (adopted June 2025) provides guidance for calculating carbon offsets, factoring in grid decarbonisation and citing Treasury Greenbook as a data source.

5.4.4. West Berkshire Council have produced a carbon offset calculator. Using this, the total carbon offset to achieve net-zero was calculated to be **£12,687.90 for the non-residential units.** Please refer to the separate offset calculator spreadsheet for these calculations.

6. Results – Residential and Non-Residential Combined

6.1.1. Using data from the residential and non-residential results sections above, a table containing the combined results across the whole development is presented below.

Table 12: Energy Summary Table – 'Be Lean', 'Be Clean' and 'Be Green' (Regulated and Unregulated emissions) across whole development.

Stage	Regulated Energy Use (kWh per annum)	Unregulated Energy Use (kWh per annum)	Total CO_2 emissions Regulated and Unregulated (Tonnes CO_2 per annum)	Percentage Reduction Of Total CO_2 emissions Regulated and Unregulated (Tonnes CO_2 per annum)
Baseline Part L 2021 of the Building Regulations Compliant Development	**1,095,893**	**459,297**	**311**	
Be Lean: Fabric First and Servicing Improvement - savings from demand reduction	**1,170,058**	**458,242**	**301**	**3%**
NEW BASELINE Be Clean: Supply energy Efficient	**497,229**	**458,242**	**137**	**56%**
Be Green: Use onsite renewable, zero and low carbon energy technologies	**193,473**	**458,242**	**98**	**68%**

6.1.2. The baseline total carbon is 311 tonnesCO_2/annum. The proposed scheme total carbon is 98 tonnesCO_2/annum. This results in a 68% reduction in total carbon across the site.

7. Sustainability Appraisal

7.1. Waste Management

7.1.1. The proposed development aims to use waste reduction procedures to enable waste reduction and diversion of waste from landfill. The goal is to minimise waste and maximise re-use of resources in response to climate change.

7.1.2. It is recommended that a waste management plan and a system of recording waste transfer (for example BRE Smartwaste) should be utilised in order to maximise diversion of waste from landfill.

7.1.3. Appropriate facilities to separate residual waste and recycling will be provided on site.

7.1.4. The management and storage of recycling and waste during both construction and occupational phases of the development will be in line with Policy SP5 of the West Berkshire Local Plan.

7.2. Flood Risk

7.2.1. The simple check provided by the environment agency illustrates the site has areas which are categorised as being in flood zone 2, with medium risk of flooding from rivers and sea.

7.2.2. In response, a professional flood risk assessment has been prepared and submitted within the application.

7.2.3. It is understood that the designs contained therein provide measures to alleviate the risk to acceptable levels.

7.2.4. Full details of the Flood Risk Assessment and any recommendations to be implemented within the development can be found in the associated report.

7.2.5. Appendix G shows the Flood Risk map for this development.

7.2.6. The development will comply with flood risk mitigation requirements laid out in Policy SP5 of the West Berkshire Local Plan.

7.3. Sustainable Urban Drainage

7.3.1. A full SuDS Report has been completed for the proposed development along with the aforementioned Flood Risk Assessment.

7.3.2. Full details of the strategy including permeable paving, rainwater harvesting, attenuation tanks and blue roofs can be found in the associated report.

7.3.3. The development will comply with SuDS requirements laid out in Policy SP5 of the West Berkshire Local Plan.

7.4. Ecology and Biodiversity

7.4.1. A full Ecological Impact Assessment has been produced for the proposed development including both an Ecological Appraisal and Preliminary Roost Assessment for bats.

7.4.2. These reports outline the approaches which will be implemented within the development to support protected species and deliver a net gain for biodiversity.

7.4.3. Approaches will include bat bricks and bat boxes to protect and enhance bat species habitats.

7.4.4. Full details can be found in the associated reports.

7.5. Planting and Greening

7.5.1. A comprehensive landscaping scheme is proposed with new planting and this will introduce rich and diverse new species on site.

7.6. Electric Vehicle Charging

7.6.1. Providing EV charging points or the ability to retrofit EV charging points is an exemplary measure for sustainability and promotes sustainable lifestyles for residents.

7.6.2. It is proposed to provide policy compliant Electric Vehicle charging points across the site. In addition, it is proposed to provide 14 charging points within the multi-storey car park. This ensures open access to EV charging for visitors to the shopping centre and other local amenities.

7.6.3. This aligns with current government policy to stop the sale of new petrol and diesel cars by 2030 (GOV.UK, November 2020).

7.7. Public Transport

7.7.1. The site of the proposed development is in an ideal area for walking, cycling and public transport connectivity, making sustainable transport highly appealing to potential residents.

7.7.2. The development is roughly a 1-minute walk from Market Street bus stop and a 2-minute walk from Cheap Street bus stop, whilst the development is only a 4-minute walk from Newbury train station.

7.7.3. Market Street and Cheap Street bus stops provide access to number 2, 2A, 2c, 3, 3a, 4, 4a, 4b, 4c, 5, 6, 7, 7A, 103a, 103b, Link and V1 buses.

7.7.4. This amount of bus routes available in such close proximity to the development site allows for sustainable transport to a range of locations including:

- *Access to the rest of Newbury;*
- *Hungerford;*
- *Eastbury;*
- *Lambourn;*
- *East and West Ilsley;*
- *Andover;*
- *Greenham;*
- *Basingstoke;*
- *Vodafone Campus;*
- *Newbury train station.*

7.7.5. Newbury train station provides easy access to London and provides a direct link to the major national rail infrastructure. Access to Newbury train station is available through walking, cycling or the V1 bus.

7.7.6. Appendix H shows the walking routes to public transport from this development.

7.7.7. A full Transport Assessment has also been carried out for this development which goes into greater detail on how the proposal meets local policy requirements for sustainable transport.

7.7.8. Full details can be found in the associated report.

7.8. Car Club

7.8.1. Car clubs are a highly effective method in reducing car ownership and directly work towards air pollution reduction targets. Residents will have access to a car club with hybrid and electric vehicles.

7.8.2. A total of 3 new car club cars are proposed that will provide flexible transport options to complement the scheme's close proximity to Newbury's railway station and bus station.

7.8.3. The implementation of these car club schemes will reduce the need for 22 private cars across the development.

7.9. Cycle Parking

7.9.1. A total of 495 cycle parking spaces will be proposed across the site in secure storage areas.

7.9.2. 4 cycle repair stations will be provided around the site (including 3 for public use) to encourage the use of bicycles.

7.10. Permeability

7.10.1. The proposals repair the connectivity and pedestrian links that were lost when the Kennet Centre was constructed which will in turn promote walking.

7.11. Local Amenities

7.11.1. The proposed development is located in the town of Newbury.

7.11.2. The location of the development within Newbury provides the proposed development with a large range of amenities in extremely close proximity, as the development is within Newbury Town Centre.

7.11.3. Whilst the Kennet Centre is being demolished as part of the development works, several of the amenities are remaining with additional amenities being constructed in the area including:

- *The existing Vue Cinema;*
- *Restaurants;*
- *Cafes;*
- *Several newly constructed shops.*

7.11.4. Outside of the Kennet Centre but within walking distance of the development in Newbury are further amenities, including but not limited to:

- *Sainsbury's supermarket, which itself also contains a Sainsbury's Pharmacy and an Argos;*
- *West Berkshire Museum;*
- *Eateries and restaurants;*
- *Pubs and bars;*
- *Newbury Canoe Club;*
- *Several churches.*
- *Northbrook Street, which is the main shopping street in Newbury providing access to:*
    - *Several clothing shops;*
    - *Boots and Superdrug;*
    - *Cafes.*

7.11.5. There are also several other supermarkets including a Tesco Superstore, Waitrose and Aldi between half a mile and a mile from the proposed development.

7.11.6. There is also a large range of schools within a short distance from the proposed development site, including up to 8 different primary/junior schools within a 5-minute drive and 2 secondary schools in the same range.

7.11.7. This number of shops, schools and attractions within a close range means that the development site is ideally located to provide for all needs in a sustainable manner, without the need for travelling large distances to access them.

7.12. Water Use

7.12.1. The criteria for measuring potable water usage are set out in Approved Document G of the Building Regulations.

7.12.2. All dwellings on site can be designed to achieve the maximum of 105 litres per person per day internal potable water, with an additional allowance for external water use of 5 litres per person per day. The total internal water consumption estimate is 101.6 litres per person per day for dwellings with a bath and shower; and 90.6 litres per person per day for any dwellings with only a shower. An additional 5L is specified for external use. The specification of water fittings will be identified at the detailed design stage.

7.12.3. Representative data has been input into the BRE's Water Efficiency Calculator for New Dwellings for relevant domestic water consuming components; dual flush WC, taps and kitchen sink taps, bath and shower. Washing machine and dishwater specification have been set to default rates as standard practice.

7.12.4. The following representative rates have been utilised:

- *Duel Flush WC – 4L & 2.6L flush volumes;*
- *Taps – 4L per minute flow rate;*
- *Bath – 195L overflow capacity;*
- *Shower – 8L per minute flow rate;*
- *Kitchen sink taps – 4L per minute flow rate.*

7.12.5. Alternative component consumption rates are available which can achieve the required water consumption. The rates provided are representative only.

7.12.6. The calculator can be found in Appendix I.

7.12.7. The calculated results show that utilisation of the representative component's water consumption can achieve a maximum of 105 litres per person per day internally, and additional external water use of 5 litres per person per day.

7.12.8. The development therefore complies with water resource management requirements laid out in Policy SP5 of the West Berkshire Local Plan.

7.13. Air Quality

7.13.1. The scheme will comprise of suitable mitigation measures for air quality.

7.13.2. An Air Quality Assessment has been prepared by Stuart Michael Associates Limited and is submitted with the planning application. Impacts from development generated traffic and the constraints on the development and during the construction process have been assessed.

7.13.3. The Assessment concludes that taking into account the proposed development's negligible increase in air pollution during the operational stage, and the "not significant" impact arising from dust during the construction stage, it can be concluded that air quality should not be a determining factor in refusing planning consent.

7.14. Noise

7.14.1. The scheme will comprise of suitable mitigation measures for noise. A noise impact assessment has been prepared and submitted with the application.

7.14.2. The report concludes that the proposed development is in accordance with WHO Guidelines, British Standards, and WBC local policy.

7.14.3. 100% of heating and hot water will come from ground source heat pumps, extracting heat from boreholes.

7.15. BREEAM

7.15.1. BREEAM New Construction Version 6.1 pre-assessments have been completed for the retail units and concierge and shared residents' area, targeting a rating of Excellent. It has been assumed that the retail units will be completed as shell only.

7.15.2. The BREEAM pre-assessment for this development illustrates a potential credit mix which can achieve 73.98% for the retail and 70.71% for the concierge and shared residents' area.

7.15.3. For more details, please refer to the BREEAM pre-assessment reports.

8. Conclusion

8.1.1. This Energy and Sustainability report has been produced to accompany the planning application for the proposed site, consisting of 317 residential dwellings, 5 shell retail units and a concierge and residents' area at Old Town, Newbury.

8.1.2. The development will incorporate a ground source heat pump district heating network, providing low carbon heat in accordance with local and national policies.

8.1.3. The average regulated carbon reductions achieved across the sample units can be seen in the results section 4.

8.1.4. A representative sample of the residential element have been assessed using SAP 10.2 compliant software, which are shown to deliver circa 71% reduction in Part L (2021) regulated emissions. This is in accordance with Policy DM4 which sets a target of a 63% reduction over the Part L 2021 baseline.

8.1.5. It can be concluded that the provision of fabric and service improvements across the site can reduce carbon emissions by over 49% against Part L1A 2021 regulations. Therefore, the proposed development is predicted to comply with the requirements of the Future Homes Standard.

8.1.6. Policy DM4 sets FEE targets for various dwelling types used on site. This report demonstrates compliance with these targets (see section 4.1) through good fabric design intent.

8.1.7. The concierge and shared residents' area and a representative sample of the proposed retail units were assessed using SBEM calculation engine v6.1.e.0, and can be seen to deliver circa 16% reduction in regulated and unregulated carbon emissions against Part L 2 (2021) regulations.

8.1.8. Policy DM4 sets a net zero carbon target which considers operational energy (regulated and unregulated), and allows for a cash in lieu payment to offset any residual carbon emissions. The proposed development aims to meet West Berkshires net zero carbon target ambition through use of renewable energy across the site in the form of ground source heat pumps connected in a district heating network and photovoltaic panels. The total carbon offset to achieve net-zero is calculated to be **£124,539.27** and **£12,687.90** for residential and non-residential development respectively.

8.1.9. The reduction in carbon emissions from regulated and unregulated energy is demonstrated in sections 4.5 and 5.3 for residential and non-residential development respectively.

8.1.10. Proposed site wide total carbon emissions per year are 98 tonnes, a 68% improvement over the Part L 2021 baseline and a 97% improvement on the existing site which produces 3,040 tonnes/yr.

8.1.11. The development strategy sets a high standard of overall sustainability, complying with Policy SP5, with measures that include:

- *Enhanced building fabric specification with a Fabric-First approach including high efficiency insulation and provision of efficient appliances;*
- *Effective waste management procedures to minimise construction waste and to divert any residual waste from landfill;*
- *The implementation of drainage, ecology and travel plans;*
- *Provision of electric vehicle charging points within residential parking areas and separately to the public car park facility;*
- *Implementation of 3 car club cars to reduce the need for 22 personal vehicles;*
- *Provision of 495 secure cycle stores and cycle repair stations;*
- *Improved pedestrian access routes;*
- *Efficient internal and external water use in line with building regulations;*
- *Opportunity to achieve BREEAM Excellent with a potential credit yield of 73.98% for the retail and 70.71% for the concierge and shared residents' area.*

8.1.12. It can therefore be seen that the proposed development:

- *Achieves Part L 2021 compliance* ☑
- *Has Low / zero carbon energy source* ☑
- *Delivers significant reduction in total carbon reductions* ☑
- *Meets likely Future Homes Standard* ☑
- *Complies with Policy DM4 & SP5* ☑

Appendix B – District Heating Information

Heat network key information

- ***Distribution loss factors and estimated efficiency (COP) sourced from proposed district heating installer ERDA:***

  Email from ERDA 26/03/2024:

specification of the HIU and distribution network. I note you have followed guidance on the DLF for now and would confirm that – should BMD/EEL be responsible for that aspect – then we would follow CP1 as a minimum. I am not sure at this stage is there is a client spec on this, but there is ***the potential*** to target 1.2 as a figure on the next calculation iteration if flow temps can be reduced?

From concept design documentation 08/24:

2. What efficiency targets are set?

CoP "as close to 4.0 possible" for efficiency targets

Direct DHW from HUI required therefore limited opportunity to reduce flow temperature. Feasibility stage target CoP 3.75 with an aim to improve in detailed design.

- ***COP of 3.75***
- ***DLF of 1.5 following CP1 as a minimum***

Heat Interface Units (HIU's)

- ***Specification of HIU currently unconfirmed. Default SAP data gives losses of 1.44kwh/day.***
- ***Figure (right) shows an example HIU. Photograph courtesy of SAV systems.***

Appendix F – Unregulated Energy Demand (Good Homes Alliance)

- ***Unregulated energy is the energy consumed by a building resulting from appliances and cooking.***
- ***SAP 10 does not calculate or set targets for unregulated energy demand.***
- ***In the 'Building Standards Compared' document (linked below) Passivhaus PHPP model has been used by the GLA to calculate unregulated energy demand for each archetype (1 bed 50m² flat, 2 bed 61m² flat, 3 bed 84m² semi house, 3 bed 84m² terraced house, and 5 bed 110m² detached house)***
- ***The GHA adopted an unregulated energy factor of 21.9kWh/m²/yr as being representative for use when reviewing varying architypes.***
- ***21.9kWh/m²/yr is at the higher end of the calculated figures and can be seen to be a reasonable estimation for the proposed development, where the average floor area is 69m². See Table 22 below.***

Table 22 – Unregulated energy demand used in calculations seen in red.

Appendix G – Flood Risk Map (Zone 2)

Environment Agency

Flood map for planning

Your reference	Location (easting/northing)	Created
Newbury	**447123/167008**	**11 Jul 2024 11:16**

Your selected location is in flood zone 2, an area with a medium probability of flooding.

This means:

- you must complete a flood risk assessment for development in this area
- you should follow the Environment Agency's standing advice for carrying out a flood risk assessment (see www.gov.uk/guidance/flood-risk-assessment-standing-advice)

Notes

The flood map for planning shows river and sea flooding data only. It doesn't include other sources of flooding. It is for use in development planning and flood risk assessments.

This information relates to the selected location and is not specific to any property within it. The map is updated regularly and is correct at the time of printing.

Flood risk data is covered by the Open Government Licence which sets out the terms and conditions for using government data. https://www.nationalarchives.gov.uk/doc/open-government-licence/version/3/

Use of the address and mapping data is subject to Ordnance Survey public viewing terms under Crown copyright and database rights 2022 OS 100024198. https://flood-map-for-planning.service.gov.uk/os-terms

1. Overall dwelling characteristics

	Area (m2)		Storey height (m)		Volume (m3)	
Main dwelling						
Ground floor	43.3500	(1b) x	2.4500	(2b) =	106.2075	(1b) - (3b)
First floor	43.3500	(1c) x	2.4500	(2c) =	106.2075	(1c) - (3c)
Total floor area TFA = (1a)+(1b)+(1c)+(1d)+(1e)...(1n)	86.7000					(4)
Dwelling volume			(3a)+(3b)+(3c)+(3d)+(3e)...(3n) =		212.4150	(5)

2. Ventilation rate

	m3 per hour		
Number of open chimneys	0 * 80 =	0.0000	(6a)
Number of open flues	0 * 20 =	0.0000	(6b)
Number of chimneys / flues attached to closed fire	0 * 10 =	0.0000	(6c)
Number of flues attached to solid fuel boiler	0 * 20 =	0.0000	(6d)
Number of flues attached to other heater	0 * 35 =	0.0000	(6e)
Number of blocked chimneys	0 * 20 =	0.0000	(6f)
Number of intermittent extract fans	3 * 10 =	30.0000	(7a)
Number of passive vents	0 * 10 =	0.0000	(7b)
Number of flueless gas fires	0 * 40 =	0.0000	(7c)
	Air changes per hour		
Infiltration due to chimneys, flues and fans = (6a)+(6b)+(6c)+(6d)+(6e)+(6f)+(6g)+(7a)+(7b)+(7c) =	30.0000 / (5) =	0.1412	(8)

SAP 10 WORKSHEET FOR New Build (As Designed) (Version 10.2, February 2022)
CALCULATION OF EPC COSTS, EMISSIONS AND PRIMARY ENERGY FOR IMPROVED DWELLING

1. Overall dwelling characteristics

	Area (m2)		Storey height (m)		Volume (m3)	
Main dwelling						
Ground floor	43.3500	(1b) x	2.4500	(2b) =	106.2075	(1b) - (3b)
First floor	43.3500	(1c) x	2.4500	(2c) =	106.2075	(1c) - (3c)
Total floor area TFA = (1a)+(1b)+(1c)+(1d)+(1e)...(1n) 86.7000						(4)
Dwelling volume			(3a)+(3b)+(3c)+(3d)+(3e)...(3n) =		212.4150	(5)

2. Ventilation rate

		m3 per hour	
Number of open chimneys	0 * 80 =	0.0000	(6a)
Number of open flues	0 * 20 =	0.0000	(6b)
Number of chimneys / flues attached to closed fire	0 * 10 =	0.0000	(6c)
Number of flues attached to solid fuel boiler	0 * 20 =	0.0000	(6d)
Number of flues attached to other heater	0 * 35 =	0.0000	(6e)
Number of blocked chimneys	0 * 20 =	0.0000	(6f)
Number of intermittent extract fans	0 * 10 =	0.0000	(7a)
Number of passive vents	0 * 10 =	0.0000	(7b)
Number of flueless gas fires	0 * 40 =	0.0000	(7c)
		Air changes per hour	
Infiltration due to chimneys, flues and fans = (6a)+(6b)+(6c)+(6d)+(6e)+(6f)+(6g)+(7a)+(7b)+(7c) =	0.0000 / (5) =	0.0000	(8)
Pressure test		Yes	
Pressure Test Method		Blower Door	
Measured/design AP50		3.0000	(17)
Infiltration rate		0.1500	(18)
Number of sides sheltered		3	(19)
Shelter factor	(20) = 1 - [0.075 x (19)] =	0.7750	(20)
